Cloud Hosting Services

AWS Services:

AWS Service	Purpose
ECS Fargate	Run Docker containers without managing servers
ALB	Load balancing + SSL termination (Optional)
ECR	Private Docker image registry
ACM	Free SSL/TLS certificates
VPC	Private networking
CloudWatch	Logs, metrics, alarms
S3	File uploads, document storage, backups
Route 53	DNS management (optional - if client has custom domain)
RDS	Managed PostgreSQL database (ALTERNATIVE to Supabase)

- If we need true load balancing (200+ users) or want simpler SSL management then only we would be using ALB
- If we want to manage DNS entirely within AWS, then only we go for Route 53, else we can use the existing domain registrar's DNS.

Azure Services:

Azure Equivalent	Notes
Azure Container Apps	Serverless containers, similar pricing
Azure Application Gateway	L7 load balancer with WAF option (Optional)
Azure Container Registry (Basic)	Private image store
Azure Managed Certificates	Free with App Gateway
Azure Blob Storage	File uploads
Azure Monitor + Log Analytics	Centralized logging
Azure DNS	DNS hosting (Optional)
Azure Virtual Network	Private networking
Azure Database for PostgreSQL	Managed PostgreSQL database

- The use of Azure Application Gateway and Azure DNS is optional and depends on the level of customization required.
